

New year resolutions, things made to be broken, or maybe this time, this one time, we (I) may succeed in making progress on what really matters now.

I wish everyone reading this article a lot of happiness in 2019 and hope you'll check to see if the resolutions I'm sharing here make sense to you and your beloved ones. I believe they can make or break our future our children and the generations to come, so we should probably not ignore them.

So what are those few things which really matters to everyone?

Number one: **The ability to distinguish Fact (Real) from Fiction** and understand the notion of Truth Hash-tag: **#ReFiT or #FaFiT** **UUID:** [ab3fb2d4-9cfa-4f72-9a5b-bebd72b0c65e](#)

Second: Understand how to use **Computers Automation and AI** to help yourself as an individual to thrive and avoid the dangers those technologies pose. Tho hash-tags: **#SelfReliant**(UUID91d101ea-d250-4298-9177-20880e1dded6) and **#informageddon**(UUID: b17ea217-e20c-4202-bb0e-954803cd2176)

#ReFiT / #FaFiT

Our life and life quality depends on how accurate our inner model of reality built by our minds since we are born reflects the actual "hard" "cold" reality. In my opinion there is nothing more important than our ability as individuals to get our inner reality model in sync with the actual common reality out there.

I have wrote two articles describing the notion of Fact Fiction and Truth (links bellow), in 2019 I would like to get a step closer to giving everyone who reads my articles a clear guide on how to produce and verify factual information by using existing technology and seek future more reliable ways to produce it.

Fact Fiction and BS (describing the notion of Fact and Fiction and the danger of consuming a mix of fact and fiction thinking is fact, a mix I call BS).

Fact Fiction and the Truth (describe the notions of Truth and Fact and how we confuse them and why it is almost impossible to detect a lie)

#SelfReliant & #informageddon

Automation is inevitable, AI is inevitable, if you think you can escape it you are fooling yourself. So, if you can't beat them join them. However, as with any new technology there are some avoidable pitfalls. The computers and AI have some very dangerous and insidious ones. Knowing them is (in some cases) literally a life and death situation. More, it is about our future as free people or as disposable (irrelevant) slaves.

There are two distinct ways this can go down.

First path is if we will try to keep the current social organization unchanged and try to graft automation and AI on it. In my opinion this is guaranteed to lead to #informageddon and irrelevant slavery, a future 99% of us will hate.

The second path (or social model) is the one where the technology of automation computers and AI are used mainly to enhance each individual in order to produce a #SelfReliant entity using a symbiosis between human and machine (carbon+silicon). Those entities will be capable of thriving in (almost) any conditions without required help from anyone else.

The society (almost as we know it) can then be rebuilt from free standing, self reliant, entities, a society which will be orders of magnitude more powerful and resilient than the current one, A society which can exist for millions or maybe billions of years. This model has the potential to lead to a social organization close to the one depicted in the SI-FI series StarTrek or even more advanced (excluding warp drives and teleportation for now) and is probably the real future incarnation of the current American-Dream.

In 2018 I've created and launched a Global Challenge hosted on <https://timenet-systems.com> in 2019 I wish to start a first iteration solution design for this challenge.

That is all!
